1. (16分)

Assume we are running code on a 6-bit machine using two's complement arithmetic for signed integers. A "short" integer is encoded using 3 bits. Fill in the empty boxes in the table below. The following definitions are used in the table:

short sy = -3; int y = sy; int x = -17; unsigned ux = x;

Note: You need not fill in entries marked with "-".

Expression	Decimal Representation	Binary Representation
Zero	0	
1	4	
1		01 0010
ux		
У		
x>>1	E - R.

2. (18分)

Consider the following 8-bit floating point representation based on the IEEE floating point format:

- There is a sign bit in the most significant bit.
- The next 3 bits are the exponent. The exponent bias is $2^{3-1} 1 = 3$.
- The last 4 bits are the fraction.
- The representation encodes numbers of the form: $V = (-1)^y \cdot M \cdot 2^E$, where M is the significand and E is the biased exponent.

The rules are like those in the IEEE standard (normalized, denormalized, representation of 0, infinity, and NAN). FILL in the table below. Here are the instructions for each field:

• Binary: The 8 bit binary representation.

- M: The value of the significand. This should be a number of the form x or x/y, where x is an integer, and y is an integral power of 2. Examples include 0, 3/4.
- E: The integer value of the exponent.
 Value: The numeric value represented.

Note: you need not fill in entries marked with "--".

Docitive infinity		One	Largest normalized (positive)	Smallest denormalized (negative)	0 100 0101	Minus zero	Description Binary M
1							E
+ 8	5.5	1.0			***	-0.0	Value

3. (6分)

```
Consider the following C functions and assembly code: int fun7(int a)
```

Which of the functions compiled into the assembly code shown?

4. (6分)

Consider the following C functions and assembly code: int fun4 (int *ap, int *bp)

return a;

int a = *ap; *bp += *ap;

Which of the functions compiled into the assembly code shown?

Page 3 of 10

5. (10 分)

Consider the source code below, where M and N are constants declared with #define.

```
int array1[M] [N];
int array2[N] [M];
int copy(int i, int j)
{
    array1[i][j] = array2[j][i];
}
```

Suppose the above code generates the following assembly code:

```
push1 %ebp
mov1 %esp,%ebp
push1 %ebx
mov1 8 (%ebp),%ecx
mov1 12 (%ebp),%ebx
leal (%ecx,%ecx,8),%edx
sal1 $2,%edx
mov1 %ebx,%eax
sal1 $4,%eax
sub1 %bbx,%eax
sub1 %pbx,%eax
sub1 $2,%eax
mov1 %eax,array1(%edx,%ebx,4)
pop1 %ebx
mov1 %ebp,%esp
pop1 %ebp
```

What are the values of M and N?

Z I

Z

6. (10分)

Consider the following assembly representation of a function foo containing a for loop:

```
push1 %ebp
mov1 %esp,%ebp
push1 %ebx
mov1 8 (%ebp),%ebx
lea1 2 (%ebx),%edx
xor1 %ecx,%ecx
cmp1 %ebx,%ecx
jge .L4

L6:
lea1 5 (%ecx,%edx),%edx
inul1 %eax,%edx
inul1 %eax,%edx
inc1 %ecx
cmp1 %ebx,%ecx
j1 .L6

L4:
mov1 %edx,%eax
pop1 %ebx,%eax
pop1 %ebp,%esp
pop1 %ebp,%esp
ret
```

Fill in the blanks to provide the functionality of the loop:

```
int foo(int a)
{
  int 1;
  int result = _____;
  for( ____; ___; i++ ) {
    _____;
  }
}
```

return result;

Page 5 of 10

7. (16分)

Consider the following C declarations:

typedef struct (
 short code;
 int start;
 char raw[3];
 double data;
) OldSensorData;

typedef struct (
 short code;
 short start;
 char raw[5];
 short sense;
 short ext;
 double data;
} NewSensorData;

A. Using the templates below (allowing a maximum of 24 bytes), indicate the allocation of data for structs of type OldSensorDataNewSensorData. Mark off and label the areas for each individual element (arrays may be labeled as a single element). Cross hatch the parts that are allocated, but not used (to satisfy alignment).

Assume the Linux alignment rules discussed in class. Clearly indicate the right hand boundary of the data structure with a vertical line.

OldSensorData:

+++++++++++++		0
Ĺ	j	-
İ		2
İ	j	ω
İ		1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23
Ī	1	ъ

B. Now consider the following C code fragment:

```
void foo(OldSensorData *oldData)
{
    NewSensorData *newData;

/* this zeros out all the space allocated for oldData */
bzero((void *)oldData, sizeof(oldData));

oldData->code = 0x104f;
oldData->start = 0x80501ab8;
oldData->raw[0] = 0xe1;
oldData->raw[1] = 0xe2;
oldData->raw[2] = 0x8f;
oldData->raw[2] = 0xff;
oldData->raw[-5] = 0xff;
oldData->data = 1.5;

newData = (NewSensorData *) oldData;
```

Once this code has run, we begin to access the elements of newData. Below, give the value of each element of newData that is listed. Assume that this code is run on a Little-Endian machine such as a Linux/x86 machine. You must give your answer in hexadecimal format. Be careful about byte ordering!.

```
(a) newData->start = 0x
```

(b) newData -> raw[0] = 0x

(d)
$$newData - raw[4] = 0x$$

Page 7 of 10

Problem 8. (18分):

The problem concerns the following C code. This program reads a string on standard input and prints an integer in hexadecimal format based on the input string it read.

finclude <stdio.h>

```
/* Read a string from stdin into buf */
int evil_read_string()
{
  int buf[2];
  scanf("%s",buf);
  return buf[1];
}
int main()
{
  printf("0x%x\n", evil_read_string());
}
```

Here is the corresponding machine code on a Linux/x86 machine:

```
804843e:
                                                                               804843b:
                                                                                                                                     8048435:
                                                                                                                                               8048434:
                                                                                                                                                         8048432:
                                                                                                                                                                   804842f:
                                                                                                                                                                              804842c:
                                                                                                                                                                                         8048427:
                                                                                                                                                                                                      8048422:
                                                                                                                                                                                                                8048421:
                                                                                                                                                                                                                          804841e:
                                                                                                                                                                                                                                     804841b:
                                                                                                                                                                                                                                                         8048417:
                                                                                                                                                                                                                                                                     8048415:
                                                                                                                                                                                                                                                                                       08048414 <evil_read_string>:

                                       format string for printf
                                                  integer arg for printf
```

you work the problem: This problem tests your understanding of the stack discipline and byte ordering. Here are some notes to help

- scanf("%s", buf) reads an input string from the standard input stream (stdin) and stores it at address buf (including the terminating '\0' character). It does not check the size of the destination buffer.
- printf("0x%x", i) prints the integer i in hexadecimal format preceded by "0x". Recall that Linux/x86 machines are Little Endian.
 You will need to know the hex values of the following characters:

Character	Hex value	Character	Hex
			value
'd'	0x64	'ν'	0×76
'r'	0×72	'i'	0×69
.`	0x2e	11'	0×6c
'e'	0x65	'\0'	0×00
		's'	0×73

A. Suppose we run this program on a Linux/x86 machine, and give it the string "dr.evil" as input on stdin. buf[1](in hexadecimal) and indicate where ebp points just after scanf returns to evilreadstring. Here is a template for the stack, showing the locations of buf[0] and buf[1]. Fill in the value of

What is the 4-byte integer (in hex) printed by the printf inside main?

- B. Suppose now we give it the input "dr.evil.lives" (again on a Linux/x86 machine).
- (a) List the contents of the following memory locations just after scanf returns to evilreadstring. Each answer should be an unsigned 4-byte integer expressed as 8 hex digits.
